ABSTRACT

Disclosed is a system that allows a video program to be broken up into video segments using markers that mark the beginning/end of each segment. Each video segment is then associated with a tag that describes the content and other information such as rating information relating to the subject matter of the video segment. Video segments can then be selected or excluded during either real time or nearly real time broadcast or on delayed broadcast to exclude the viewing of certain video clips based on user preferences or to allow the viewing of only certain chosen subject matter in accordance with user preferences.
